Rest Record Service

2021-04-29 - Natalia - Comments (0) - ARTICLES

About Rest Web Service

REST is a modern easy-to-use application program interface (API) based on a widely adopted architectural style. The services provide users with seamless access to NetSuite record metadata, support API discoverability, offer link-based navigation and give users a uniform approach to interacting with both custom and standard records.
Key Points of the REST Web Service

- Pre-build endpoint
- NetSuite schema can be obtained via Metadata integration
- Fast development and easy deployment of integration
- Execution speed of the requests
- Human readable data in body: JSON format
- Supporting SuiteAnalytics workbooks
- Still some records and features in Beta
- Limitation of data query service to 1 000 records
- Searches are not available for use
- No further processing is possible (like in case of Restlet)
- No support of Legacy tax codes

The latest integration features using Rest WS offer 3 main operations:

- Metadata
- REST Record Service
- REST Query service

About REST Record Service

All SuiteScript records available in the NetSuite 2020.1 are supported in REST to maximize coverage of business objects. Using REST web services, you can perform CRUD (create, read, update, delete) operations on NetSuite records. The following sections provide information about the structure of NetSuite records, and the ways you can work with records using REST web services.Please note that certain records may still be in beta status, so be sure to review the API and developer documentation to learn more.

For those who haven't tried out these powerful new REST web services, spend some time exploring news ways to integrate NetSuite with other applications and environments managed by your organization.
